

Loans4India — Complete End-to-End Platform Flow

1. CUSTOMER ENTERS THE PLATFORM

Entry points

The customer can arrive through:

- Google/search
- SEO landing page
- Google/Meta advertising
- Referral
- Affiliate/DSA
- Employer partnership
- Direct website
- WhatsApp journey

The homepage should **not immediately force a loan application**.

Instead:

"Find the loan you're most likely to get approved for."

The project direction already calls for a conversion layer, loan-intelligence layer, trust/education layer, application layer and financial dashboard.

2. CUSTOMER DISCOVERY

The customer can browse without creating an account.

Website

Home

- Personal Loans
- Business Loans
- Home Loans
- LAP
- Education Loans
- Vehicle Loans
- Credit Cards
- EMI Calculator
- Eligibility Calculator
- Affordability Calculator
- Credit Score
- Loan Guides
- FAQs
- Videos
- Check Eligibility

Primary CTA

Check My Eligibility

Not:

Apply Now

This distinction reduces friction.

3. QUICK ELIGIBILITY

Customer enters only the minimum information required initially.

Loan Type
↓
Loan Amount
↓
Monthly Income
↓
Employment Type
↓
City
↓
Age
↓
Existing EMI
↓
Mobile Number

Then:

Send OTP

4. REGISTRATION

Mobile Number
↓
OTP
↓
Mobile Verified
↓
Create Account
↓
Consent
↓
Customer Dashboard

At this point create:

Customer ID

+

Lead ID

Do **not** create a full loan application until the customer actually proceeds.

5. CUSTOMER PROFILE

Now progressively collect the deeper profile.

Personal

- Full name
- DOB
- Gender where required
- Address
- PIN
- City
- Residence type

Employment

- Salaried / self-employed / business
- Employer/business name
- Employment duration
- Monthly income
- Salary mode
- Designation
- Industry

Financial

- Existing loans
 - Existing EMI
 - Credit cards
 - Approximate obligations
 - Requested loan
 - Loan purpose
 - Desired tenure
-

6. CONSENT + CREDIT CHECK

Before credit information is obtained:

Credit Check Explanation

Purpose

Consent

Credit/Bureau Request

Result

The consent itself should become an auditable record.

RBI's digital-lending framework emphasizes need-based data collection, explicit consent, clear privacy policies and appropriate audit trails. ([Reserve Bank of India](#))

7. ELIGIBILITY ENGINE

Now Loans4India calculates the customer's preliminary eligibility.

Customer Profile

Income

Employment

Age

Existing EMI

Credit Profile

Requested Amount

Location

Employment Category

Eligibility Engine

Eligible Products

Important distinction:

Eligibility ≠ approval.

The platform should show an estimate, not promise approval.

8. LENDER MATCHING ENGINE

This is the heart of Loans4India.

The architecture you've developed deliberately separates the deterministic lender rules from the AI/decisioning layer, which is the right design.

9. CUSTOMER SEES MATCHED OFFERS

Example:

Lender	Profile Fit	Amount	Rate	TAT
Lender A	High	₹5L	11.2%	24–48h
Lender B	High	₹5L	11.8%	1–3 days
Lender C	Medium	₹4L	12.4%	2–4 days

Each offer should explain:

Why this lender?

- ✓ Income matches
- ✓ Employment matches
- ✓ Loan amount fits
- ✓ Existing EMI within range
- ✓ Location supported

Do not expose an "approval probability" as a guaranteed outcome.

10. CUSTOMER SELECTS OFFER

Customer clicks:

Continue Application

Now the platform creates the formal:

Application ID

Example:

LI-2026-000123

Initial state:

DRAFT

11. FULL APPLICATION

Now collect everything required for the selected product/lender.

Personal

Employment

Financial

Banking

Loan requirement

References where required

KYC

Consent

The user should see:

Application Progress

 80%

Personal ✓

Employment ✓

Financial ✓

KYC ✓

Documents ●

Review ○

Submit ○

12. DOCUMENT CENTER

The platform creates lender/product-specific document slots.

Example:

PAN

✓ Uploaded

Aadhaar

✓ Uploaded

Salary Slip 1

✓ Uploaded

Salary Slip 2

✓ Uploaded

Salary Slip 3

✓ Uploaded

Bank Statement

● Pending

The implementation already defines multi-file document slots and document versioning.

13. DOCUMENT SECURITY PIPELINE

This happens automatically.

UPLOAD

File Validation

Magic-byte Validation

Quarantine

Malware Scan

OCR / Extraction

Document Classification

Store Clean Version

Available for Review

Your implementation plan explicitly has quarantine/clean storage, malware scanning, version increments and document replacement.

14. CUSTOMER SUBMITS APPLICATION

Customer sees:

Review Application

Loan Amount: ₹10,00,000

Tenure: 60 Months

Employment: Salaried

Income: ₹80,000

Selected Lender: XYZ Bank

Documents: 100% Complete

[Submit Application]

Customer confirms consent/declarations.

Then:

DRAFT → SUBMITTED

15. BACK OFFICE TAKES OVER

This is where the **human operational layer** begins.

The application enters:

Application Queue

Admin sees:

Application	Customer	Loan	Owner	Status	Priority
LI-00123	Rahul	₹10L	Amit	Submitted	High

LI-00124 Priya ₹5L Neha Docs
Pending Medium

The implementation defines a 360° applications queue with search, filters, assignment and prioritization.

16. APPLICATION ASSIGNMENT

Operations Manager/Team Lead assigns the case.

Application
↓
Operations Queue
↓
Team Lead
↓
Loan Operations Executive
↓
Assigned Owner

The owner becomes responsible for moving the application forward.

17. 360° APPLICATION WORKSPACE

The admin opens the application.

I would structure it as:

APPLICATION

- |
- | — Overview
- | — Customer
- | — Financial Profile
- | — Documents
- | — Eligibility
- | — Lender Handoff
- | — Queries
- | — Timeline

- Notes
- Communication
- Sanction
- Disbursement
- Commission

Your implementation plan already defines Overview, Documents, Lender Handoff, Timeline & Notes, and Disbursement & Commission as dedicated tabs.

18. DOCUMENT REVIEW

Loan Operations Executive checks every document.

For each document:

Document

- View
- Accept
- Reject
- Request Replacement

If rejected:

Reason:

- Blurry
- Name mismatch
- Expired
- Missing page
- Incorrect document
- Unreadable
- Other

Then:

Customer receives ACTION_REQUIRED

The customer returns to:

Dashboard

Application

The implementation specifically covers this review/replacement loop.

19. LENDER-READY GATE

This is a critical control.

Admin should **not** be able to submit an incomplete application.

Mandatory Documents

The implementation specifically requires the **Lender-Ready Gate** to remain disabled until all mandatory documents are accepted.

20. LENDER ELIGIBILITY CHECK

Before submission:

Selected Lender

Product

Eligibility Rules

Income

Age

CIBIL

FOIR

Employment

Location

Loan Amount

PASS / FAIL

If FAIL:

Do not submit

Show reason

Re-run lender matching

Select alternative lender

This prevents bad-quality submissions.

21. LENDER ASSIGNMENT

Admin selects:

Partner

Lender

Loan Product

Example:

HDFC Bank

Personal Loan

₹10L

60 months

The implementation includes a lender master/product master with lender-specific document lists and deterministic criteria.

22. SUBMISSION PACKAGE

The system generates a standardized lender package.

Application Summary PDF

+

Customer Data

+

Accepted KYC

+

Income Documents

+

Bank Statements

+

Audit Cover Sheet

Then:

ZIP / API / Portal

↓

Lender

The current implementation explicitly supports a unified submission package and submission logging.

23. LENDER SUBMISSION

Application becomes:

SUBMITTED_TO_LENDER

Admin records:

- Submission date
- Submission channel
- Lender
- External application number
- Submitting officer
- Attempt number

Then the customer sees:

✓ Application Submitted

Lender: XYZ Bank

Reference:
XYZ123456

Current Status:
Lender Reviewing

Expected Update:
24–48 hours

24. LENDER PROCESSING

Now the lender is the decision-maker.

Possible states:

IN_PROGRESS
↓
QUERY_RAISED
↓
SANCTIONED
↓
APPROVED

Or:

IN_PROGRESS
↓
REJECTED

25. LENDER QUERY

This is a very important loop.

Example:

"Latest salary credit statement required."

Back Office:

Lender

Query

Admin records query

Customer notification

Customer:

Dashboard

Action Required

View Query

Upload Response

Submit

Then:

Customer Responded

Admin Review

Forward to Lender

Lender Processing

Your current implementation explicitly covers both customer query response and admin query resolution.

26. LENDER APPROVES

Suppose lender approves:

Lender

Sanction Letter

Admin Uploads/Records Sanction

Application = APPROVED

Admin records:

- Sanctioned amount
- Interest rate
- Tenure
- EMI
- Processing fee
- Lender reference
- Sanction date
- Sanction letter

Customer sees:

LOAN APPROVED

₹10,00,000

Interest: 11.5%

Tenure: 60 months

EMI: ₹21,996

[Continue to Agreement]

27. AGREEMENT

Depending on lender integration:

Agreement

eSign / Video KYC / Lender Process

↓
Agreement Completed

The customer should see the exact next action.

28. DISBURSEMENT

Once the lender disburses:

Lender
↓
Disbursement
↓
Bank Account
↓
UTR

Back Office records:

- Disbursed amount
- Disbursement date
- Loan account number
- UTR
- Lender
- Sanction evidence

The implementation already has a disbursement recording workflow with UTR, loan account number and sanction evidence.

29. CUSTOMER SEES DISBURSED

- ✓ Application Submitted
- ✓ Documents Verified
- ✓ Lender Approved
- ✓ Agreement Completed
- ✓ Loan Disbursed

Then:

30. COMMISSION ENGINE

Only now should the platform recognize the distribution commission according to the applicable commercial agreement.

Disbursement

Commission Rule

Expected Commission

Commission Ledger

Pending

Example:

Loan Disbursed

₹10,00,000

Applicable commission:

1.25%

Expected:

₹12,500

That percentage is only an implementation example from your existing test plan, **not a recommended universal commercial rate.**

31. FINANCE RECONCILIATION

Bank pays Loans4India.

Bank Payout

Credit Advice / Bank Statement

The Finance Reconciliation Workspace is already specified for matching lender payout batches against pending commissions and identifying mismatches.

32. APPLICATION CLOSED

Final operational lifecycle:

↓
CLOSED

Rejected applications don't simply disappear.

They should go through:

REJECTED

↓

Rejection Reason

↓

Eligibility Reassessment

↓

Alternative Lender

↓

READY_FOR_LENDER

↓

SUBMITTED_TO_LENDER

Your current QA plan explicitly tests lender rejection followed by rerouting to another lender with an incremented submission attempt.

33. WHAT EACH ADMIN ROLE ACTUALLY DOES

This is where I would make your RBAC extremely precise.

Role	Primary responsibility
Super Admin	Platform-wide configuration and exceptional controls
Operations Manager	Queue management, assignment, escalation, SLA
Loan Operations Executive	Application/document review and lender submission
Document/KYC Reviewer	Document verification
Lender/Partner Manager	Lender relationships, products and lender configurations
Customer Support	Customer communication, status/help, non-sensitive support

Sales/Relationship Manager	Lead follow-up and customer conversion
Compliance Officer	KYC, consent, compliance reviews, escalations
Fraud Analyst	Fraud/suspicious applications
Finance Executive	Disbursement verification, commission and reconciliation
Data/Reporting Analyst	Operational/business reporting
Content/SEO Manager	Website CMS, landing pages, SEO/content
Marketing Manager	Campaigns, attribution and acquisition
System/Technical Admin	Integrations, API health, system configuration

34. OPERATIONS MANAGER

Their screen should be:

Dashboard

- Application Queue
- High Priority
- SLA Breaches
- Unassigned
- Action Required
- Lender Pending
- Escalations
- Team Productivity

They **do not need unrestricted access to every financial or KYC operation.**

Their job is orchestration.

35. LOAN OPERATIONS EXECUTIVE

This is your main processing employee.

They can:

- Open applications
- Review customer information
- Review documents
- Reject documents
- Request replacement
- Verify eligibility
- Assign/select lender where permitted
- Generate submission package
- Submit to lender
- Record lender responses
- Create lender queries
- Track application
- Escalate

They should **not** be able to:

- Change commission rules
 - Reconcile bank payouts
 - Create admin users
 - Change RBAC
 - Modify lender commercial contracts
-

36. DOCUMENT/KYC REVIEWER

Focused workspace:

Document Queue

Application

Document

Compare

Accept / Reject / Replace

No need to expose:

- Finance
- Commission

- Revenue
- System configuration

This follows least-privilege access.

37. PARTNER/LENDER MANAGER

This person manages:

Lenders

—	Bank/NBFC Profile
—	Products
—	Eligibility Rules
—	Required Documents
—	TAT
—	Geographic Coverage
—	API/Portal
—	Commercial Terms
—	Status
—	Performance

They should be able to see lender performance but **not directly alter customer documents or financial settlements**.

38. FINANCE

Finance gets:

Finance Dashboard

—	Disbursements
—	Expected Commission
—	Received Commission
—	Pending
—	Reconciliation
—	Disputes
—	Settlements

└─ Reports

Finance should not automatically have access to full Aadhaar/PAN/document downloads.

Your architecture already distinguishes finance permissions from sensitive customer/KYC access.

39. COMPLIANCE

Compliance gets:

Compliance Dashboard

- └─ KYC
- └─ Consent
- └─ Document Audit
- └─ Exceptions
- └─ Regulatory Cases
- └─ Complaints
- └─ Audit Trail

They investigate exceptions rather than processing every normal application.

40. FRAUD

Fraud gets:

Fraud Queue

- └─ Duplicate PAN
- └─ Duplicate Mobile
- └─ Duplicate Bank Account
- └─ Multiple Devices
- └─ Suspicious IP
- └─ Document Anomalies
- └─ Identity Mismatch
- └─ High-Risk Applications

A flagged application can become:

FRAUD_REVIEW

rather than automatically being rejected.

41. CUSTOMER SUPPORT

Support should have a deliberately restricted workspace.

They can see:

Customer

↓

Application

↓

Current Status

↓

Required Action

↓

Communication History

They can:

- Answer status questions
- Send approved communications
- Help with document requests
- Create tickets
- Escalate
- Trigger permitted notifications

They should **not** be able to approve applications or manipulate lender/commission records.

42. SUPER ADMIN

Super Admin is the exception layer.

Users

Roles

Permissions
Lenders
Products
Rules
Configurations
Integrations
Feature Flags
Audit
System Health

But even Super Admin actions should be heavily audited.

The architecture calls for immutable audit trails covering sensitive operations, role changes, configuration changes, document access and application status changes.

43. THE ADMIN SIDE SHOULD RUN LIKE AN AIR-TRAFFIC-CONTROL SYSTEM

The most important mental model is:

The customer should never have to understand this internal complexity.

The customer sees:

What do I need to do next?

The Operations team sees:

What is blocking this application?

The Lender Manager sees:

Which lender should receive it?

Finance sees:

Was the loan disbursed and was our commission received?

Compliance sees:

Was the process compliant and auditable?

Management sees:

Where are applications leaking and where is revenue being lost?

44. THE SINGLE SOURCE OF TRUTH

I would make **Application** the central business object.

Everything attaches to it:

APPLICATION

That gives you one complete case file.

Your current implementation is already moving in exactly this direction with the 360° Application Workspace and immutable timeline.

45. What I would consider the final Loans4India operating model

And the **actual business loop** is:

That is the platform you should build—not merely a website with an admin panel.

The biggest architectural principle: the customer journey, Back Office workflow, lender workflow, document system, finance system and audit system must all operate on the **same**

application state machine. Your current implementation plan is already very close to this model.
