

# Loans4India — Platform Flow v2 (Virtual Corporate DSA)

Oct 3, 2026 · @JP

## Summary

Loans4India is a **Virtual Corporate DSA layer**. It finds borrowers, collects and checks their application data with consent, prepares a clean application, and hands it to a partner bank or NBFC. It does **not** underwrite, sanction, disburse or service loans. The bank does all of that.

**Design principle:** the platform is built around DSA-led application management and secure application-data handoff. Automation comes in step by step, as bank partnerships and system access become available.

**Project definition:** a virtual Corporate DSA platform that digitises acquisition, onboarding, secure data and document management, data-quality review, application preparation and controlled submission into partner banks' systems. Banks keep every banking responsibility. Any future lending or other regulated activity is a separate strategic and regulatory decision.

## What changed from v1

| Area                              | v1 (retired)                                                       | v2 (this doc)                                                                 |
|-----------------------------------|--------------------------------------------------------------------|-------------------------------------------------------------------------------|
| Role of Loans4India               | Marketplace that matches lenders, shows offers and tracks approval | Corporate DSA that sources and prepares applications; bank decides everything |
| Eligibility and offers            | Eligibility engine, approval probability, rate/EMI offer cards     | No eligibility promises or offers; only completeness and data-quality checks  |
| Lender selection                  | Matching engine ranks lenders for the customer                     | Back office routes to a bank where a DSA agreement exists                     |
| Sanction, agreement, disbursement | Shown as platform steps                                            | Bank-only steps; platform records them only when the bank confirms            |

| Area                       | v1 (retired)                                         | v2 (this doc)                                                       |
|----------------------------|------------------------------------------------------|---------------------------------------------------------------------|
| Identity checks            | Platform KYC                                         | Pre-checks allowed by the DSA agreement; bank does KYC              |
| Bank access                | Assumed live                                         | Not signed yet (as of 2 Oct 2026); handoff is configurable per bank |
| Status and commission data | Assumed real-time                                    | Mostly arrive as bank MIS and payout files                          |
| Customer language          | "Apply Now" vs "Check Eligibility", offers, approval | "Apply for a loan", "a loan sourcing service, not a lender"         |

## Responsibility boundary

Loans4India owns everything up to the handoff, plus tracking and commission. The bank owns every credit and banking decision. The platform never shows an application as approved, sanctioned or disbursed unless the bank has confirmed it.

| Activity                          | Loans4India                                     | Bank / NBFC                                |
|-----------------------------------|-------------------------------------------------|--------------------------------------------|
| Lead generation and acquisition   | Responsible                                     | May set sourcing criteria                  |
| Initial applicant data collection | Responsible                                     | Defines required fields                    |
| Consent capture and recordkeeping | Responsible                                     | Defines rules for receiving and using data |
| Initial data-quality checks       | Responsible                                     | Runs its own validation                    |
| Identity and document pre-checks  | Only as the DSA agreement permits               | Required KYC and verification              |
| Application preparation           | Responsible                                     | Defines format and documents               |
| Entry into bank system            | Authorised DSA activity, once access is granted | Provides approved access                   |

| Activity                                  | Loans4India                               | Bank / NBFC                |
|-------------------------------------------|-------------------------------------------|----------------------------|
| Credit assessment and underwriting        | Not responsible                           | Responsible                |
| Approval or rejection                     | Not responsible                           | Solely responsible         |
| Sanction and agreement                    | Not responsible                           | Responsible                |
| Disbursement and servicing                | Not responsible                           | Responsible                |
| DSA status tracking                       | Responsible for the information available | Provides updates as agreed |
| Commission calculation and reconciliation | Tracks and reconciles                     | Pays per agreement         |

Internal verification improves application quality. It never replaces the bank's KYC, underwriting or compliance.

# End-to-end flow at a glance

## Loans4India prepares and hands off; the bank decides

end-to-end flow · Loans4India vs bank

Loans4India runs everything up to **Ready for Bank Handoff**, then tracks and reconciles. The shaded band is the bank's side; nothing in it is decided or shown by Loans4India until the bank confirms it.

## Customer journey

From the first form onward, the customer is filling in a **Loan Application**. They never see the word "lead", and they never see an eligibility score, an offer or an approval that the bank hasn't confirmed.

1. **Arrive.** Website, campaigns, referrals, affiliates or other approved channels.  
Attribution is captured on the application record.
2. **Start a loan application (Enquiry).** Loan type, amount, mobile number. Mobile is verified by OTP.
3. **Give consent.** A clear notice says what data is collected, why, and which bank it may be shared with. Consent is stored as an auditable record with a timestamp and version.
4. **Complete the profile (Profile).** Personal, employment, income and loan requirement.  
Collect only what the target bank's process needs.
5. **Upload documents (Documents).** A checklist per bank and product shows what's needed and what's missing. Aadhaar is masked, and the full number is never stored.
6. **Wait for the internal check.** The customer sees "Under review by Loans4India". If something is missing or unclear, they get an **Action needed** task.
7. **Handoff to the bank (Ready for Bank → Submitted to Bank).** The customer sees "Submitted to <bank>" only once a bank reference, acknowledgement or authorised operator confirmation exists.
8. **Bank-led steps.** Bank KYC, credit assessment, decision, sanction, agreement and disbursement all happen on the bank's side. The customer sees each one only as the bank reports it.
9. **Withdraw at any time.** The customer can withdraw the application or revoke consent. Either one triggers the retention and purge rules.

**Customer-facing status labels:** Application started · Details needed · Documents needed · Under review by Loans4India · Action needed · Submitted to bank · Bank is reviewing · Bank needs information · Bank decision received · Loan disbursed by bank · Withdrawn.

## Back office DSA operations

The back office turns a raw application into a complete, bank-ready package. It never makes a credit judgement.

1. **Intake and dedupe.** New applications land in a queue. Duplicates (same PAN, mobile or bank account) are flagged and can be marked *Duplicate / Rejected internally*.

2. **Assignment.** A team lead assigns the application to a DSA operations executive, who owns it until handoff.
3. **Verification review.** The executive checks completeness, document expiry, readability, and PAN-to-name match through a licensed provider. Where automation isn't available, the review is manual. This is a data-quality check, not KYC.
4. **Action needed loop.** For a missing or bad item, the executive raises a task with a reason (blurry, name mismatch, expired, missing page, wrong document). The customer fixes it and the application returns to review.
5. **Application preparation.** Data is mapped from the canonical record onto the target bank's template: its fields, format and document list. A completeness check must pass in full.
6. **Internal review.** A second person (or the team lead) confirms the package. The application then moves to **Ready for Bank Handoff**.
7. **Exceptions.** Suspicious patterns go to a fraud/exception review, not straight to rejection. Withdrawn or consent-revoked applications leave the queue and enter purge.

Every action is logged against the user, with a time and a before/after value.

## Bank handoff

The handoff is a separate layer, and each bank's onboarding picks the channel. Until a bank is signed, the platform stops at **Ready for Bank Handoff**.

| Channel                          | When it applies                                       | Notes                                                                   |
|----------------------------------|-------------------------------------------------------|-------------------------------------------------------------------------|
| Master DSA (sub-DSA / connector) | While direct bank agreements are pending              | Applications go to an established master DSA, which submits to the bank |
| Authorised manual entry          | Bank gives the DSA portal access but no upload or API | Named operator credentials only, never a pooled login                   |
| Bank portal upload               | Bank's portal accepts the files                       | No RPA or scripted portal entry without the bank's written approval     |
| Bulk upload                      | Bank accepts batch files                              | Template versioned per bank                                             |

| Channel | When it applies                    | Notes                                               |
|---------|------------------------------------|-----------------------------------------------------|
| API     | Bank authorises an API integration | Acknowledgements, status sync, retries, idempotency |

**Evidence rule:** an application becomes **Submitted to Bank** only with a bank reference, an acknowledgement, or an authorised operator's confirmation. If the bank returns it, it moves to **Handoff Failed / Returned by Bank**, with the reason recorded.

**Operator rules:** DSA staff who key into bank systems complete background checks, training and the code of conduct as part of onboarding.

## Bank processing and status tracking

After the handoff, the bank is the only decision-maker. Loans4India records what the bank reports and follows up. It never infers a status.

- **Bank-led steps:** KYC and due diligence, credit assessment, underwriting, approval or rejection, sanction, agreement, disbursement, servicing.
- **How updates arrive:** mostly as bank MIS files, plus portal checks and, later, API status sync.
- **MIS file import:** upload the file, match rows on bank reference or lead ID, and update bank-confirmed status. Unmatched or conflicting rows go to an **exception queue**.
- **Bank query:** when the bank asks for more, the application moves to **Bank Query / Action Required**. The customer gets a task, and the executive returns the response through the same channel.
- **Follow-ups:** each application in bank processing has an owner and a next follow-up date. The ops lead's view shows stale ones.

Internal statuses and bank-confirmed statuses are stored as **separate fields**. Neither one overwrites the other.

# Application lifecycle

**Submitted to Bank needs bank evidence; the bank sets every state after it**

application lifecycle · main path

Internal states and bank-confirmed states are stored as separate fields. The exception states below can interrupt the main path.

| Exception state                   | Entered from                  | What happens next                                   |
|-----------------------------------|-------------------------------|-----------------------------------------------------|
| Duplicate / Rejected Internally   | Intake, Verification Review   | Closed with a reason; no handoff                    |
| Customer Withdrawn                | Any state before disbursement | Closed; retention and purge rules apply             |
| Consent Expired / Revoked         | Any state                     | Triggers purge; each purge leaves an audit record   |
| Handoff Failed / Returned by Bank | Submitted to Bank             | Back to Internal Review with the bank's reason      |
| Bank Query / Action Required      | Bank Processing               | Customer task via ops, then back to Bank Processing |

## Commission and reconciliation

Revenue is DSA commission, paid under each executed bank agreement. Commission is recognised as expected only after the bank reports a disbursement.

1. **Track** attribution, handoff, bank reference, and the approval and disbursement the bank reports.
2. **Calculate expected commission** from the commission terms configured for that bank and product.
3. **Import payout files.** Match them on bank reference or lead ID.
4. **Reconcile** expected vs received vs outstanding. Discrepancies go to an exception queue.
5. **Tax handling:** TDS under section 194H, plus GST on the invoice.
6. **Clawbacks:** reverse commission when a bank claws it back, and keep a link to the original entry.

Rates, eligibility, payout timing, clawback rules and permitted charges come from each agreement. They are configuration, never hardcoded.

## Roles, access and PAM

MVP1 starts with four roles. The split below is a proposal; the source notes ask for "4-role RBAC" without naming the roles. More roles come later, as volume and bank count grow.

| Role (proposed)          | Can do                                                                                           | Cannot do                                         |
|--------------------------|--------------------------------------------------------------------------------------------------|---------------------------------------------------|
| Admin                    | Users, roles, bank templates, configuration, audit view                                          | Edit application data without an audit entry      |
| Ops Lead                 | Queues, assignment, internal review sign-off, exceptions, follow-ups                             | Change commission terms or roles                  |
| DSA Operations Executive | Review data and documents, raise Action needed, prepare packages, record handoff and bank status | See commission or finance data; download bulk PII |
| Finance                  | Payout imports, reconciliation, TDS/GST, clawbacks                                               | View full KYC documents                           |

**Later roles:** compliance, fraud/exception reviewer, customer support, lender/partner manager, reporting.

### PAM and governance:

- Sensitive actions need elevated, time-bound access (document download, bulk export, config change).
- Bank-system access uses one named credential per operator, never a shared DSA login.
- All document views and downloads are logged.
- Regular access reviews.

## Data, consent and compliance guardrails

No live customer data before a bank is signed. Until then there is no lawful "share with a bank" purpose under DPDP, so MVP1 is built and tested on synthetic data.

- **Go-live gate for real applicants:** at least one executed agreement (direct or through a master DSA) that names the bank in the consent notice.

- **Consent:** purpose-specific, versioned and auditable. Revocation or expiry moves the application to **Consent Expired / Revoked** and triggers purge.
- **Retention and purge:** after handoff, data is kept only as long as each bank's configured rule allows, then purged. Each purge leaves an audit record.
- **Aadhaar:** no Aadhaar authentication unless Loans4India is an AUA/KUA or it runs through the bank. Mask Aadhaar and never store the number.
- **Safe pre-checks:** completeness, document expiry, and PAN/name match via a licensed provider.
- **LSP classification:** expect a customer-facing site to be treated as a Lending Service Provider. That means being listed by the bank, having a grievance officer, and showing lender-named disclosures. Once more than one bank is shown, unbiased multi-lender display rules apply.
- **Security:** private document storage, encryption, RBAC, access audit, immutable audit trail.

## MVP1 scope and acceptance

MVP1 is a secure DSA foundation on synthetic data that ends at **Ready for Bank Handoff**. It covers the Admin Back Office, PAM, the Figma/design baseline, and the data and workflow foundation.

### In scope (trimmed):

- Application record with consent and audit: details, requirement, attribution, consent, status, dedupe, change history
- 4-role RBAC plus PAM
- Document storage with a completeness checklist (private, encrypted, access-logged)
- Verification review workflow, manual where automation isn't available
- One configurable bank template (fields, document list, package)
- Internal queue: assignment, Action needed, internal review, Ready for Bank Handoff
- Handoff design only: fields, checklist, package and status, built ready for future portal, upload and API channels

**Out of scope for MVP1:** live bank entry, API integrations, MIS and payout imports, commission engine, customer-facing go-live with real data.

### Acceptance criteria:

- ☐ Authorised users can create, review and track application records

- ☐ Consent, information, documents and verification status are recorded and traceable
- ☐ Sensitive data is restricted by role
- ☐ Completeness check and structured preparation run against the bank template
- ☐ An application can reach the handoff-ready state
- ☐ Every action is auditable
- ☐ Bank requirements are configurable, not coded
- ☐ Nothing implies bank receipt or approval without confirmation

## Phased automation roadmap

Automation is added per bank, only after that bank approves it

phased automation · 4 phases, 2 gates

Each bank moves through these phases on its own timeline. A bank that never allows an API stays in phase 2, and that is fine.

## Customer-facing language rules

Loans4India facilitates loans; it never provides them. There is no RBI "DSA licence". A Corporate DSA is a contract with each bank or NBFC, with separate onboarding and a separate DSA code per lender.

| Use                                     | Never use                              |
|-----------------------------------------|----------------------------------------|
| "Apply for a personal loan"             | "We give loans" / "Get a loan from us" |
| "A loan sourcing service, not a lender" | "RBI-licensed DSA"                     |

| Use                                                                     | Never use                                                     |
|-------------------------------------------------------------------------|---------------------------------------------------------------|
| "Submitted to <bank>" (after bank confirmation)                         | "Approved" / "Sanctioned" before the bank confirms            |
| Loan Application (from the first form)                                  | Lead (internal word only)                                     |
| "Get loan offers from partner banks" (only after agreements are signed) | Bank names, logos or "partner banks" claims before agreements |

Internal application stages: **Enquiry → Profile → Documents → Ready for Bank.**

## Open decisions

- ☐ Start as a sub-DSA under a master DSA while direct agreements progress? Banks often want a track record, net worth and audited financials first.
- ☐ Which bank is first, and which channel does its onboarding allow (manual entry, portal, bulk upload, API)?
- ☐ Final names and permissions for the four MVP1 roles.
- ☐ Which loan products go first (for example, salaried personal loans)?
- ☐ Licensed provider for PAN/name match.
- ☐ Retention period per bank, once the agreements state it.
- ☐ Grievance officer and LSP disclosures before the customer site goes live.
